
Identifying Genetic Variants that Influence Atopic Dermatitis

Lavinia Paternoster

Senior Lecturer in Genetic Epidemiology

MRC Integrative Epidemiology Unit, University of Bristol, UK

19th November 2018

Outline

- Atopic dermatitis as a complex genetic trait
- Statistical methods to identify associations
- How to conduct a Genome-Wide Association study (GWAS)
- What GWAS of AD have found
- Next steps

Complex Trait Genetic Associations

Monogenic

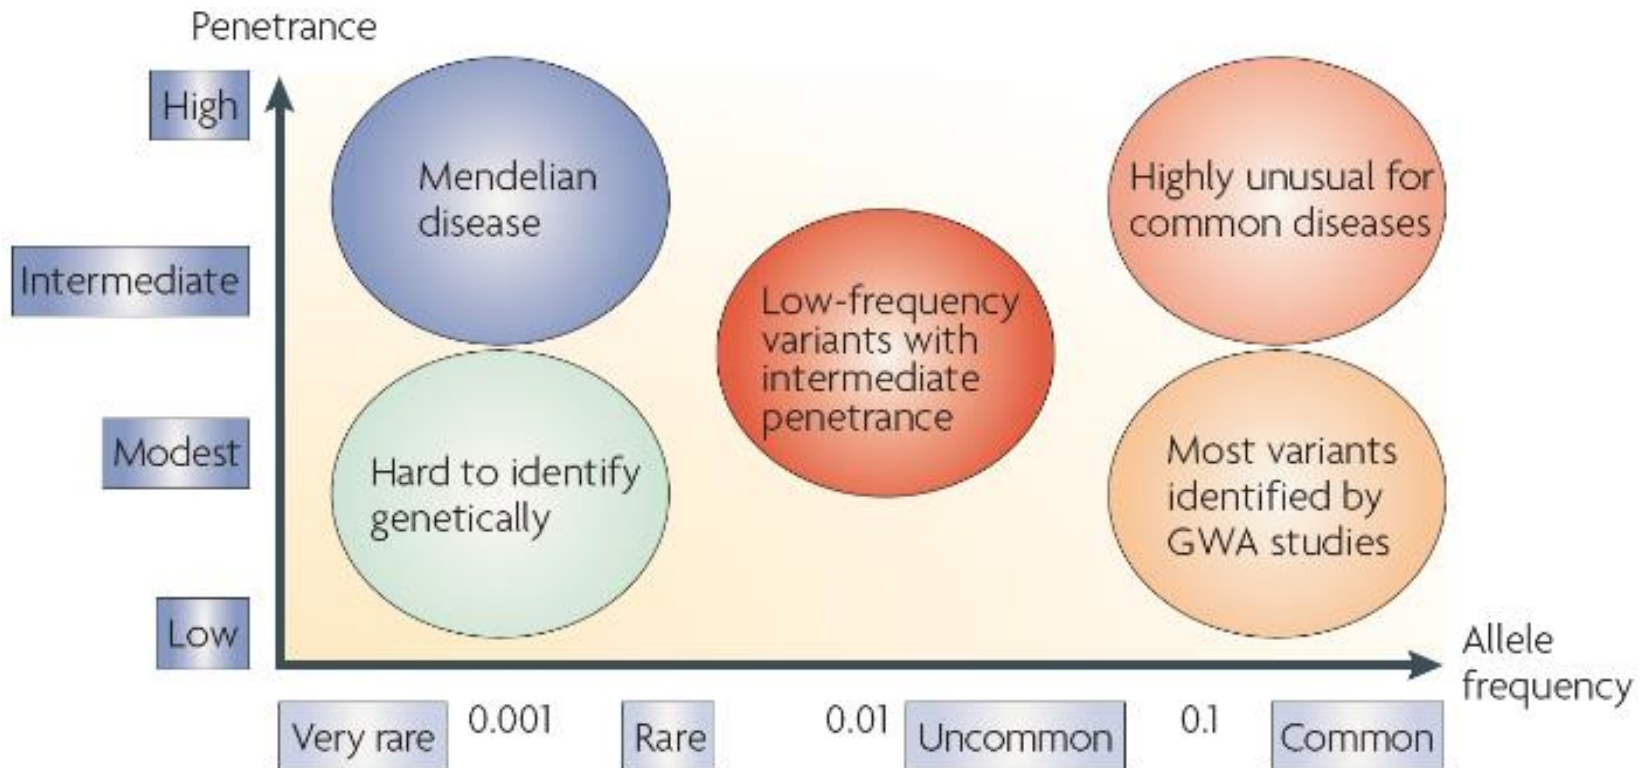

- Distinct model of inheritance
- Often rare
- Single gene - high penetrance
- Limited environmental influences

Complex

- No distinct mode of inheritance
- Often common
- Multiple loci – each with a small effect
- Important environmental factors

Complex Trait Genetic Associations

McCarthy, M. I. *et al.* Genome-wide association studies for complex traits: Consensus, uncertainty and challenges. *Nature Reviews Genetics* **9**, 367 (2009)

Atopic Dermatitis Heritability

- Risk of child developing eczema is higher if one or both parents have AD, OR=3.4 (Dold, 1992, AoDC)

Arch Dis Child. 1992 Aug; 67(8): 1018–1022.

PMCID: PMC1793604

Genetic risk for asthma, allergic rhinitis, and atopic dermatitis.

[S Dold](#), [M Wjst](#), [E von Mutius](#), [P Reitmeir](#), and [E Stiepel](#)

- Twin studies suggest a heritability of >80% (Bataille, 2012, JEADV)

[J Eur Acad Dermatol Venereol](#). 2012 Sep;26(9):1067-73. doi: 10.1111/j.1468-3083.2011.04444.x. Epub 2012 Jan 14.

The use of the twin model to investigate the genetics and epigenetics of skin diseases with genomic, transcriptomic and methylation data.

[Bataille V](#)¹, [Lens M](#), [Spector TD](#).

Finding associated variants

Case/Control Study for a single SNP:

Statistical methods

- Logistic regression
 - Exposure = SNP – coded as 0, 1, 2 (i.e. # of alt. alleles)
 - Outcome = Eczema (case/control) – coded as 0,1 (binary)
 - Covariates = Age, Sex, Ancestry – various coding

$$Disease = \beta_0 + \beta_1 SNP + \beta_2 sex + \beta_3 age + \beta_4 ancestryPC1 \dots$$

- Extend to Genome-wide ---->>>> Just repeat this simple statistical test for each SNP (>1 million times)
- Get 1 result per SNP tested

GWAS software – Plink (cog-genomics.org/plink/2.0)

Input:

ID	Ecz	sex	age	ancestryPC1	...
001	0	0	6.3	0.987645	...
002	0	1	7.5	0.874624	...
003	1	0	3.2	0.967283	...
004	1	1	0.8	0.123645	...

ID	SNP1	SNP2	SNP3	SNP4	SNP...
001	0	0	2	1.1	...
002	2	1	2	1.9	...
003	0	1	2	1.5	...
004	1	1	2	0.1	...

Output:

SNP	Effect Allele	Effect allele freq	OR	Lower CI	Upper CI	P-value
SNP1	A	0.54	1.00	0.90	1.10	0.998
SNP2	G	0.2	0.95	0.89	1.01	0.089
SNP3	T	0.9	1.12	1.10	1.14	0.001

Study Design Issues

- **Genetic data – genotyping array and imputation**

- Use genome-wide genotyping chip
- Every study imputes to same genetic reference

- **Confounders – only confounder is ancestry**

- Calculate principal components of ancestry using genetic data (and software such as Eigenstrat or Plink)
- Adjust for these components in the analysis

- **Multiple testing**

- Conducting >1 million tests $p < 0.05$ is not sufficient evidence
- GWAS significance is $p < 5 \times 10^{-8}$

- **Sample size**

- To achieve required p-value, large sample sizes are needed
- Usual to conduct meta-analysis of several cohorts

Conducting a GWAS study

Sample recruitment

Data collection

Phenotype data preparation

GWAS

Meta-analysis

Interpret

Genotyping

Genotype quality control & imputation

GWAS results summary

Manhattan plot

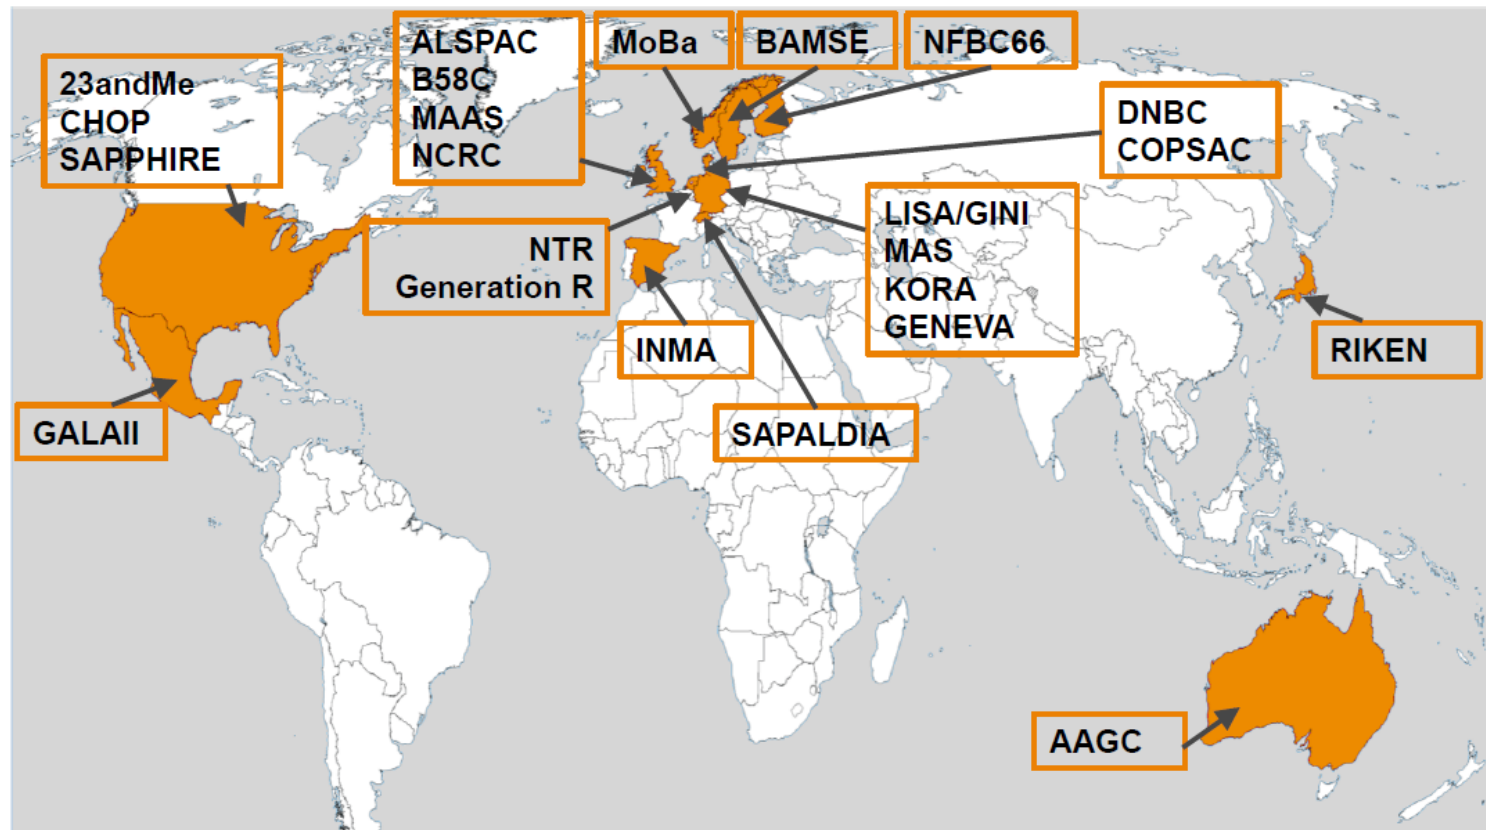

Results table

SNP	Effect Allele	Effect allele freq	OR	Lower CI	Upper CI	P-value
SNP1	A	0.54	1.00	0.90	1.10	0.998
SNP2	G	0.2	0.95	0.89	1.01	0.089
SNP3	T	0.9	1.12	1.10	1.14	0.001

What have Atopic Dermatitis GWAS found?

EAGLE GWAS 2015: 21,399 cases, 95,464 controls
all imputed to 1000 Genomes

What have Atopic Dermatitis GWAS found?

31 loci

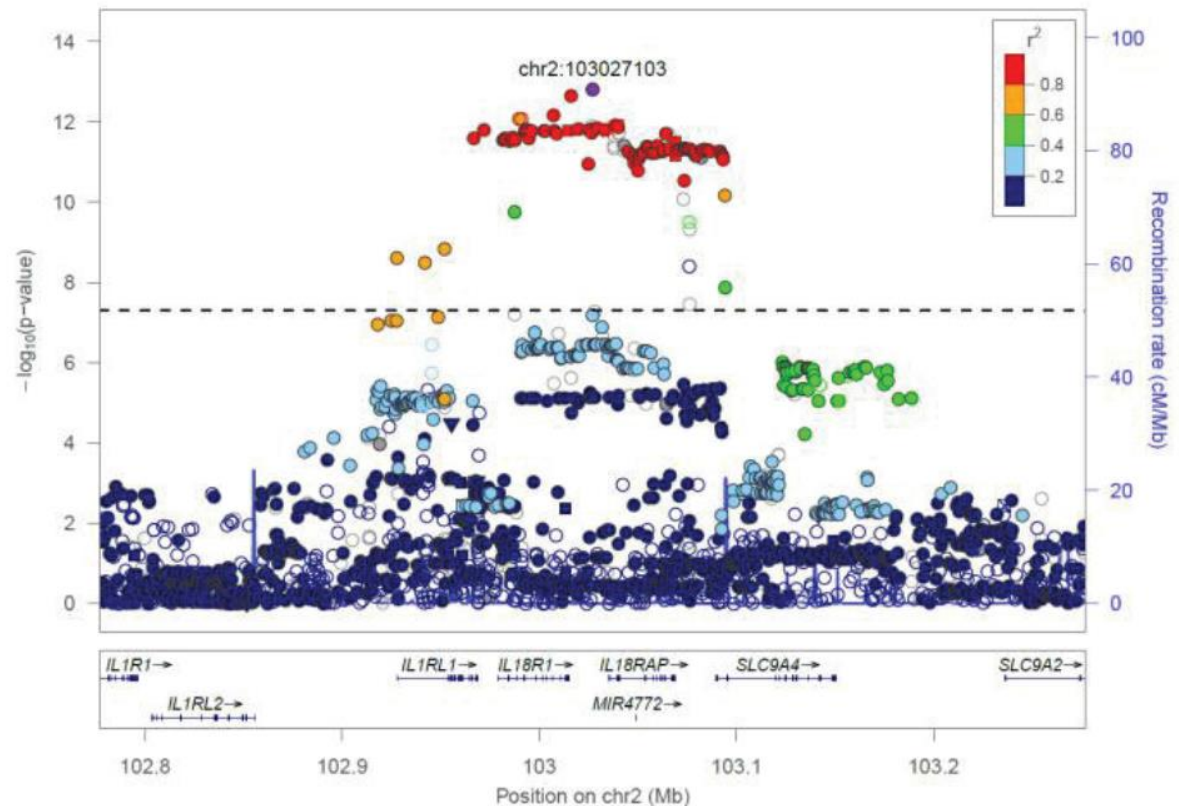

What have Atopic Dermatitis GWAS found?

Next steps

GWAS identify loci not causal genes.....

In tomorrow's Bioinformatics session we'll discuss how to identify genes!

We can use the genetic data to cluster individuals.. using PCA

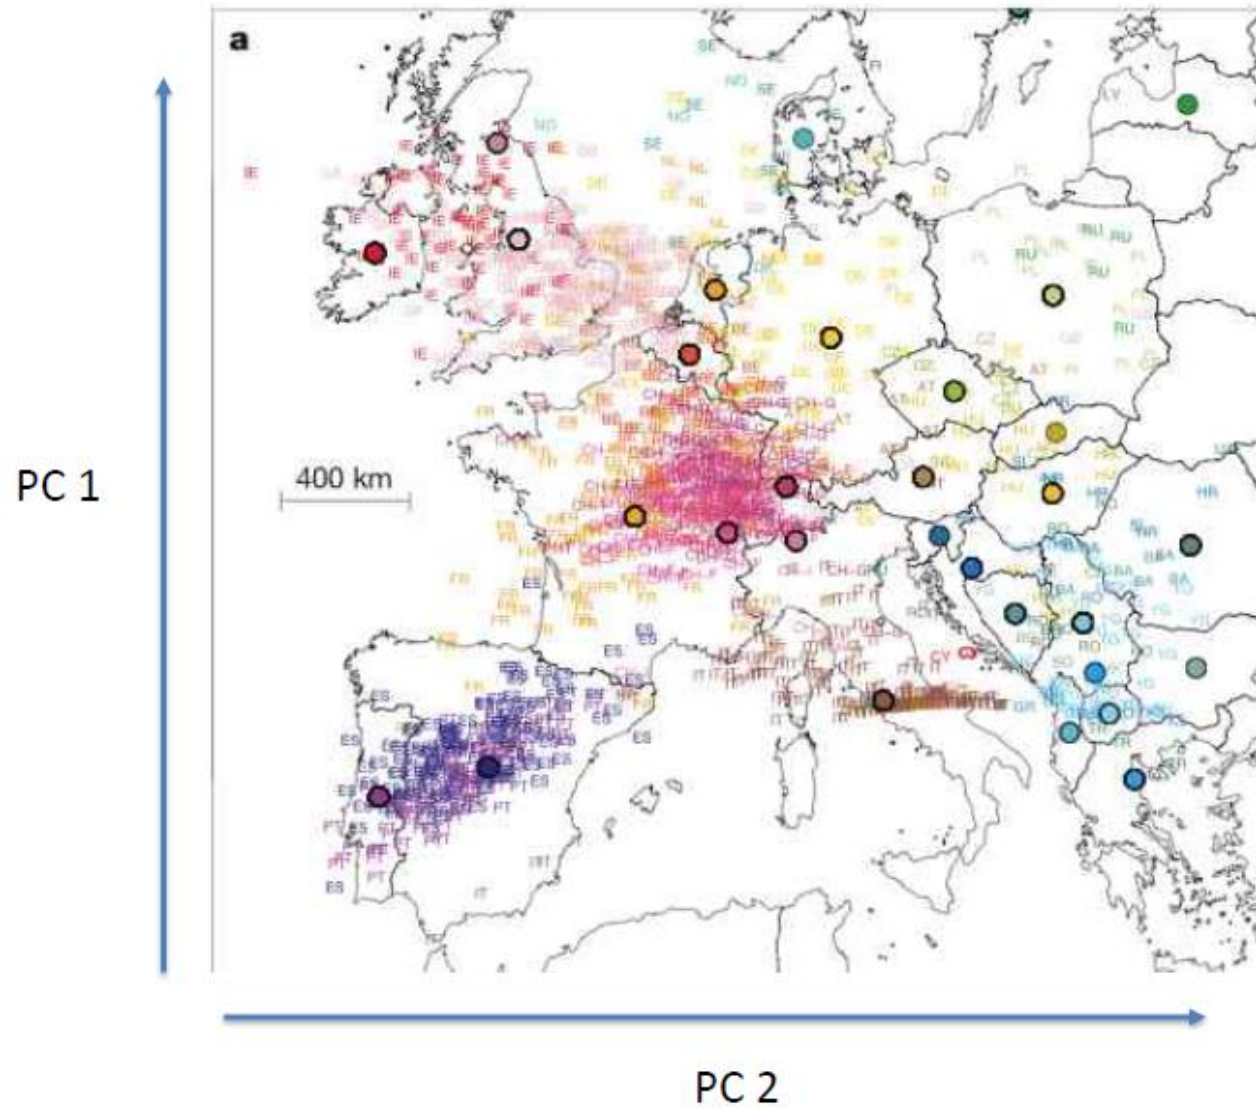

Principal components analysis (PCA) is a method for summarising high dimensional data

If you apply PCA to our genetic data it will take the 500,000 columns and turn them into far fewer columns

Those columns represent the main axes of variation that the SNPs share in common

What do these axes represent in real life...?

PCs across Europe
